

Abstract

The object of the invention is to provide a cost-effective
5 alternative for the extending of the degree of local
freedom in the use of in-house terminal devices. In the
method according to the invention, for the purpose of
transmitting telecommunications signals, telecommunications
signals received from the telecommunications network (1) of
10 the network operator are forwarded via the local, in-house
power supply network (5) of the end customer. The local,
in-house power supply network (5) of the end customer
includes a facility (7) for generating a connection between
the telecommunications network (1) of the network operator
15 and the in-house power supply network (5) of the end
customer for the purpose of rendering possible the
transmission of telecommunications signals via the in-house
power supply network (5) of the end customer.
